# **Security check**

Security Testing

---

# **Provjera sigurnosti**

## Security Testing

# Software correctness check (general)

---

- Program testing, program verification, program testing

- detection of errors or defects within the program

- the success of the test is proportional to the number of errors found

- According to the purpose of testing

- Verification - verification of correctness (good implementation)

- Validation - confirmation of validity (real, acceptable product)

- According to the check object

- Structural (white-box testing) - source code

- Functional (black-box) - compilation

- According to the verification method

- static analysis - no startup, source code or .NET MSIL, Java Bytecode

- dynamic analysis - by running, which does not exclude the source code

# Provjera ispravnosti softvera (općenito)

---

- ◆ Testiranje programa, provjeravanje programa, ispitivanje programa
  - otkrivanje pogrešaka odnosno nedostataka unutar programa
  - uspješnost testa razmjerna je broju pronađenih pogrešaka
- ◆ Prema svrsi testiranja
  - Verifikacija - ovjera ispravnosti (dobra provedba)
  - Validacija - potvrda valjanosti (pravi, prihvatljiv proizvod)
- ◆ Prema objektu provjere
  - Strukturalno (white-box testing) - izvorni kod
  - Funkcionalno (black-box) - kompilat
- ◆ Prema načinu provjere
  - staticka analiza - bez pokretanja, izvorni kod ili .NET MSIL, Java Bytecode
  - dinamička analiza - pokretanjem, što ne isključuje izvorni kod

# Key terms

---

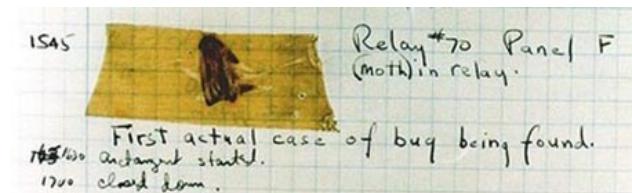

- **["normal"] Test**-verifies that some aspect of the software is correct
- **Security test**-tries to prove that some part is not working properly

- **Error(error)** - an omission by the programmer, eg due to misunderstanding  
- leads to one or more failures  
- we distinguish in relation to "error" which means an unwanted state, i.e. a malfunction

- **Failure(fault), defect, informally bug** - defective part of the code  
- eg wrongly assuming that an array is indexed by 1 instead of 0 causes an array element access failure

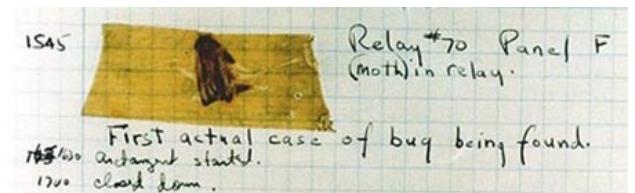

- **A standstill**in operation (failure) - condition caused by one or more malfunctions  
- eg system shutdown due to "buffer overrun" error

- **Correction(Fix)** - state of repair

# Ključni pojmovi

- ◆ [„normalan”] **Test** - provjerava je li neki aspekt softvera ispravan
- ◆ **Test sigurnosti** - nastoji dokazati da neki dio ne radi kako treba
- ◆ **Pogreška** (error) - propust programera, npr. radi nerazumijevanja
  - dovodi do jednog ili više kvarova
  - razlikujemo u odnosu na "pogrešku" koja znači neželjeno stanje, tj. kvar
- ◆ **Kvar** (fault), **defekt** (defect), **neformalno bug** - neispravan dio koda
  - npr. pogrešna pretpostavka da se polje indeksira od 1 umjesto 0 izaziva kvar pristupa elementu polja
- ◆ **Zastoj** u radu (failure) - stanje izazvano jednim ili više kvarova
  - npr. prestanak rada sustava zbog kvara "buffer overrun"
- ◆ **Ispravak** (Fix) - stanje popravka

# Application security verification procedures

---

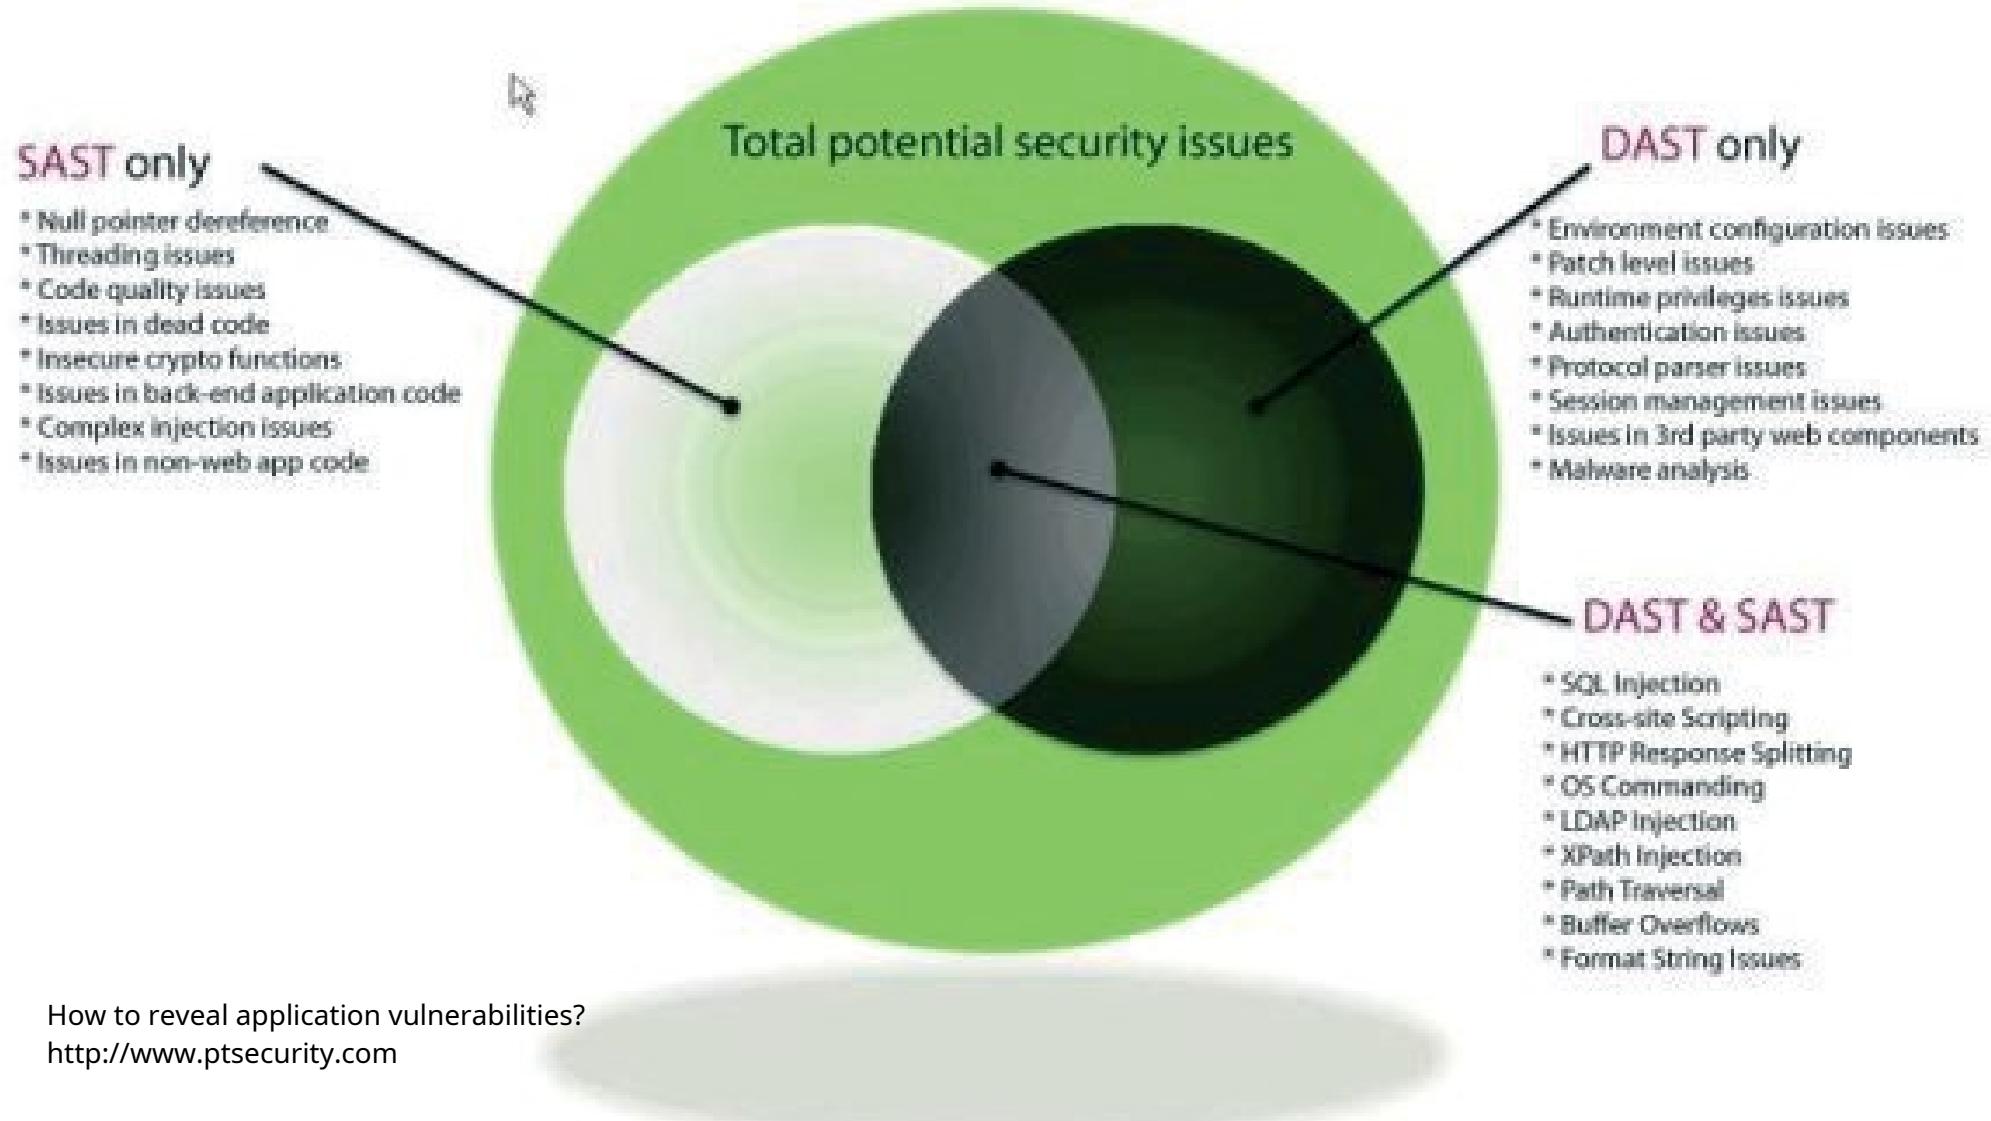

- Supervision ("Technical Reviews", "Code Reviews", "Inspections", ...)
  - testing tends to cause deadlock, monitoring looks for malfunction
- Static Application Security Testing (**SAST**) # white-box static
  - which does not require execution
  - access to the source code on the client and on the server
- Dynamic Application Security Testing (**DAST**) # black-box dynamic
  - requires execution
  - does not have access to the source code and operating environment on the server
- Interactive Application Security Testing (**IAST**) # white-box dynamic
  - dynamic with access to the source code and operating environment on the server
- Source code analysis - static or dynamic with access to the entire code

# Postupci provjere sigurnosti aplikacija

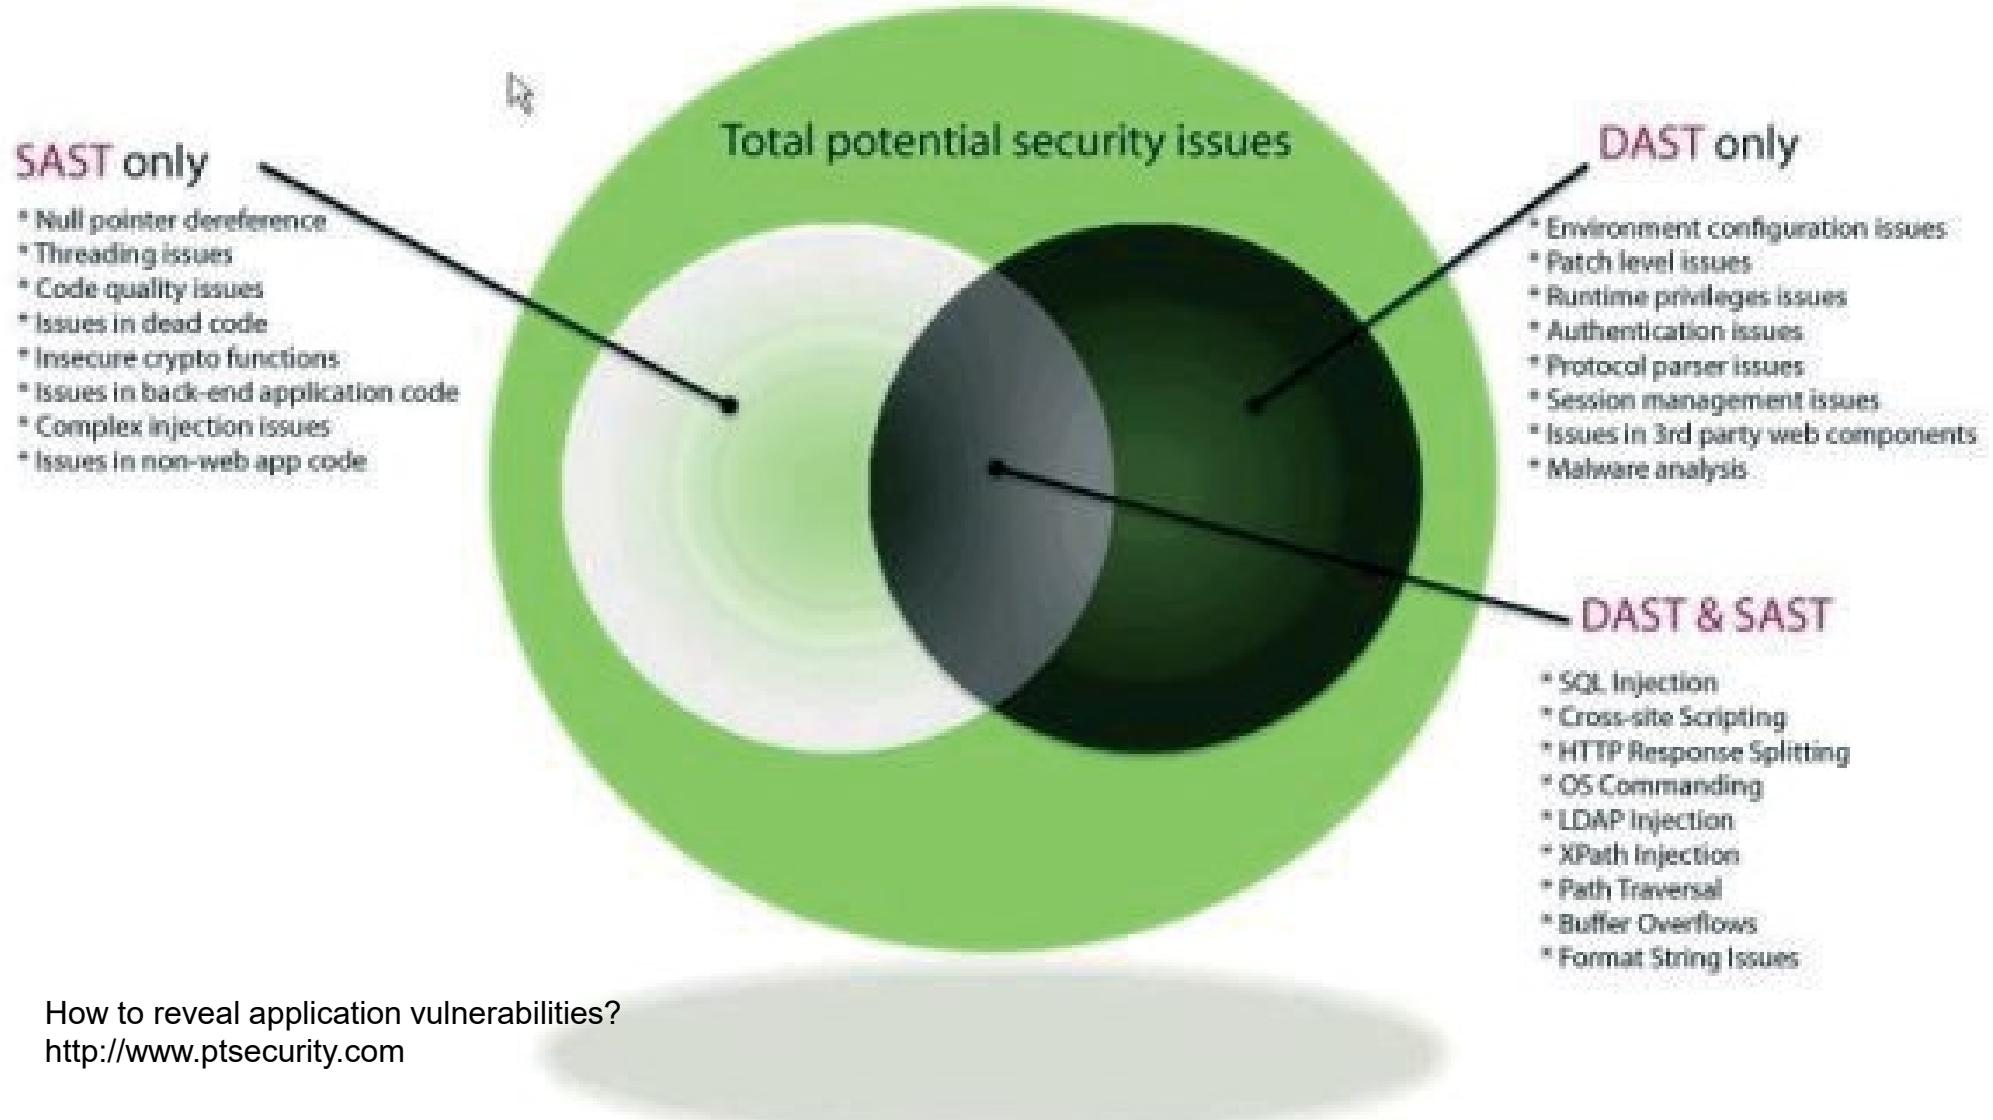

---

- ◆ Nadzor (“Technical Reviews”, “Code Reviews”, "Inspections", ...)
  - testiranje nastoji izazvati zastoj, nadzor traži neispravnost
- ◆ Static Application Security Testing (**SAST**) # white-box statička
  - koja ne zahtijeva izvršenje
  - pristup izvornom kodu na klijentu i na serveru
- ◆ Dynamic Application Security Testing (**DAST**) # black-box dinamička
  - zahtijeva izvršenje
  - nema pristup izvornom kodu i pogonskoj okolini na serveru
- ◆ Interactive Application Security Testing (**IAST**) # white-box dinamička
  - dinamička s pristupom izvornom kodu i pogonskoj okolini na serveru
- ◆ Analiza izvornog koda - statička ili dinamička s pristupom čitavom kodu

# How to reveal application vulnerabilities?

# How to reveal application vulnerabilities?

How to reveal application vulnerabilities?  
<http://www.ptsecurity.com>

---

## **Supervision**

Security Review, Code Reviews, Inspection

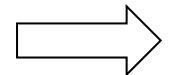

---

# Nadzor

Security Review, Code Reviews, Inspection

# Revision, review (peer review)

---

## -Variants

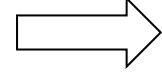

- inspection
- Team review
- Walkthrough

## -Use it

- finding defects earlier in the life cycle - up to 80% before testing
- finding defects with less effort than testing
  - IBM - review 3.5 h/defect, test 15-25 h/defect
- finding different defects than by testing - design and requirements problems
- teaching developers - not to repeat the same mistakes

# Revizija, recenzija (peer review)

---

- ◆ Varijante 
  - Inspekcija (inspection)
  - Timski pregled (team review)
  - Prohod (walkthrough)
- ◆ Koristi
  - nalaženje defekata ranije u životnom ciklusu - do 80% prije testiranja
  - nalaženje defekata s manje napora nego testiranjem
    - IBM - pregled 3.5 h/defekt, test 15-25 h/defekt
  - nalaženje drugačijih defekata nego testiranjem - problemi dizajna i zahtjeva
  - poduka razvojnika - da ne ponavljaju iste pogreške

# Inspection

---

- Formal process
- Thorough coverage of separate roles
  - Moderator - leads the meeting, monitors problems
  - The reader - paraphrases (retells) the code, not the author
  - Recorder - records defects
  - Author - provides code context, explains, fixes after review
- Checklists for specific objectives
- Data collection for error tracking
- Determining the need for subsequent inspections
- Extensive documentation of effectiveness
  - 16-20 defects/kLOC inspections vs. 3 defects/kLOC passes

- ◆ Formalni proces
  - Temeljita pokrivenost odvojenim ulogama
    - Moderator - vodi sastanak, prati probleme
    - Čitalac - parafrazira (prepričava) kod, nije autor
    - Zapisničar - evidentira defekte
    - Autor - osigurava kontekst koda, objašnjava, popravlja nakon pregleda
  - Kontrolne liste za specifične ciljeve
  - Prikupljanje podataka za praćenje pogrešaka
  - Određivanje potrebe za narednim inspekcijama
- ◆ Opsežna dokumentacija učinkovitosti
  - 16-20 defekt/kLOC inspekcije naspram 3 defekt/kLOC prohoda

# Inspection process

---

## -Planning

- the author initiates, the moderator equips, the meeting prepares the inspection package

## -Preparation

- reviewers review, use checklists and analytical tools, mark defects

## -Meeting

- the reader recounts, the reviewers comment and question, the recorder records
- the team concludes the code evaluation

## -Processing

- the author fixes

## -Control (follow-up)

- the moderator verifies the correctness of the changes, the author reports the code (check-in)

# Proces inspekcije

- ◆ Planiranje
  - autor inicira, moderator ekipira, skupa pripreme inspekcijski paket
- ◆ Priprema
  - recenzenti pregledavaju, koriste kontrolne liste i analitičke alate, označavaju defekte
- ◆ Sastanak
  - čitalac prepričava, recenzenti komentiraju i zapitkuju, zapisničar evidentira
  - tim zaključuje procjenu koda
- ◆ Prerada
  - autor popravlja
- ◆ Kontrola (follow-up)
  - moderator verificira korektnost promjena, autor prijavljuje kod (chek-in)

# Variants

---

## -Team review

- Team inspection ("light" inspection)
- Persons: moderator, reviewers (who are not code authors)
- Modules or smaller sets of classes
- 1-2 hours, < 1 kLOC

## -Walkthrough

- The author leads the meeting and explains the code
- A less formal process
- Undefined process
- No checklists or metrics

# Varijante

---

- ◆ Timski pregled
  - Timski pregled ("lagana" inspekcija)
  - Osobe: moderator, recenzenti (koji nisu autori koda)
  - Moduli ili manji skupovi klase
  - 1-2 sata, < 1 kLOC
  
- ◆ Prohod (walkthrough)
  - Autor vodi sastanak i objašnjava kod
  - Manje formalan proces
  - Nedefiniran proces
  - Nema kontrolnih lista ili metrike

## Other procedures

---

### -Pair programming

- Guide (driver) and observer (observer, navigator)
- Change of roles and partners

### *-Peer deskcheck*

- Only one reviewer with the author
- informal review
- may include checklists and other procedures

### *-Pass around(circular addition?)*

- multiple, simultaneous *Peer deskcheck*
- multiple reviewers (same code)

# Drugi postupci

---

- ◆ Programiranje u paru
  - Vodič (driver) i promatrač (observer, navigator)
  - Zamjena uloga ali i partnera
- ◆ *Peer deskcheck*
  - Samo jedan recenzent uz autora
  - neformalna recenzija
  - može uključiti kontrolne liste i druge postupke
- ◆ *Pass around* (kružno dodavanje?)
  - višestruki, istodobni *Peer deskcheck*
  - više recenzenata (istog koda)

# **Static check**

Static Analysis

# **Statička provjera**

Static Analysis

# Static analysis

---

## -SAST (Quick and Dirty)

- Code analysis without execution
- It covers everything but testing
- Using the code analyzer
- It can be part of a code review

## -Limitations: false detection and false non-recognition

- False Positives**-non-existent bugs, powerlessness with complex code or external
- False Negatives**-failure to recognize bugs, complexity of code, weakness of rules

# Statička analiza

---

- ◆ SAST (Quick and Dirty)
  - Analiza koda bez izvršavanja
  - Obuhvaća sve osim testiranja
  - Korištenje analizatora koda
  - Može biti dio revizije koda
- ◆ Ograničenja: pogrešno otkrivanje i pogrešno neprepoznavanje
  - **False Positives** - nepostojeći bugovi, nemoć pri složenom kodu ili vanjskom
  - **False Negatives** - neprepoznavanje bugova, složenost koda, slabost pravila

# Types of static analysis

---

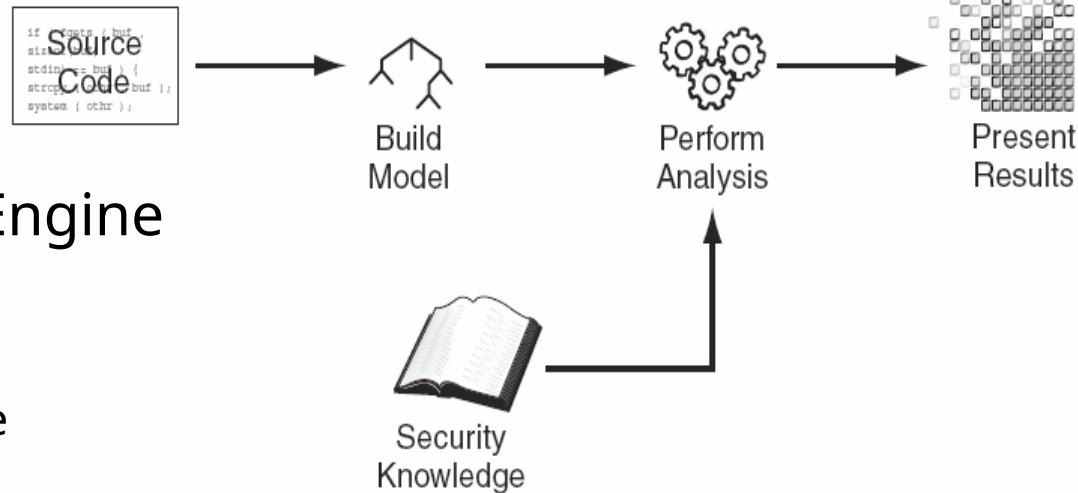

- Type checking - part of the programming language
  - ex. int i = "abc";
- Style checking - good practices
  - Rules - spaces/spaces, nomenclature, comments, ...
- Program understanding - inferring meaning
  - All method usage, global variable declaration finding, ...
- Property checking - ensuring that there is no bad behavior
  - For example memory leak : if (malloc() == NULL)
- Program verification (Program verification) - ensuring correct behavior
  - For example free(mem);
- Bug finding - detection of possible errors
  - Bug patterns

# Vrste statičke analize

---

- ◆ Provjera tipova (Type checking) - dio programskog jezika
  - pr. int i = "abc";
- ◆ Provjera stila (Style checking) - dobre prakse
  - Pravila - praznine/proredi, nazivlje, komentari, ...
- ◆ Razumijevanje programa (Program understanding) - zaključivanje značenja
  - Sva korištenja metode, nalaz deklaracije globalnih varijabli, ...
- ◆ Provjera svojstava (Property checking) - osiguranje da nema lošeg ponašanja
  - Npr. curenje memorije : if (malloc() == NULL)
- ◆ Verifikacija programa (Program verification) - osiguranje ispravnog ponašanja
  - Npr. free(mem);
- ◆ Traženje pogrešaka (Bug finding) - otkrivanje mogućih pogrešaka
  - Obrasci bugova

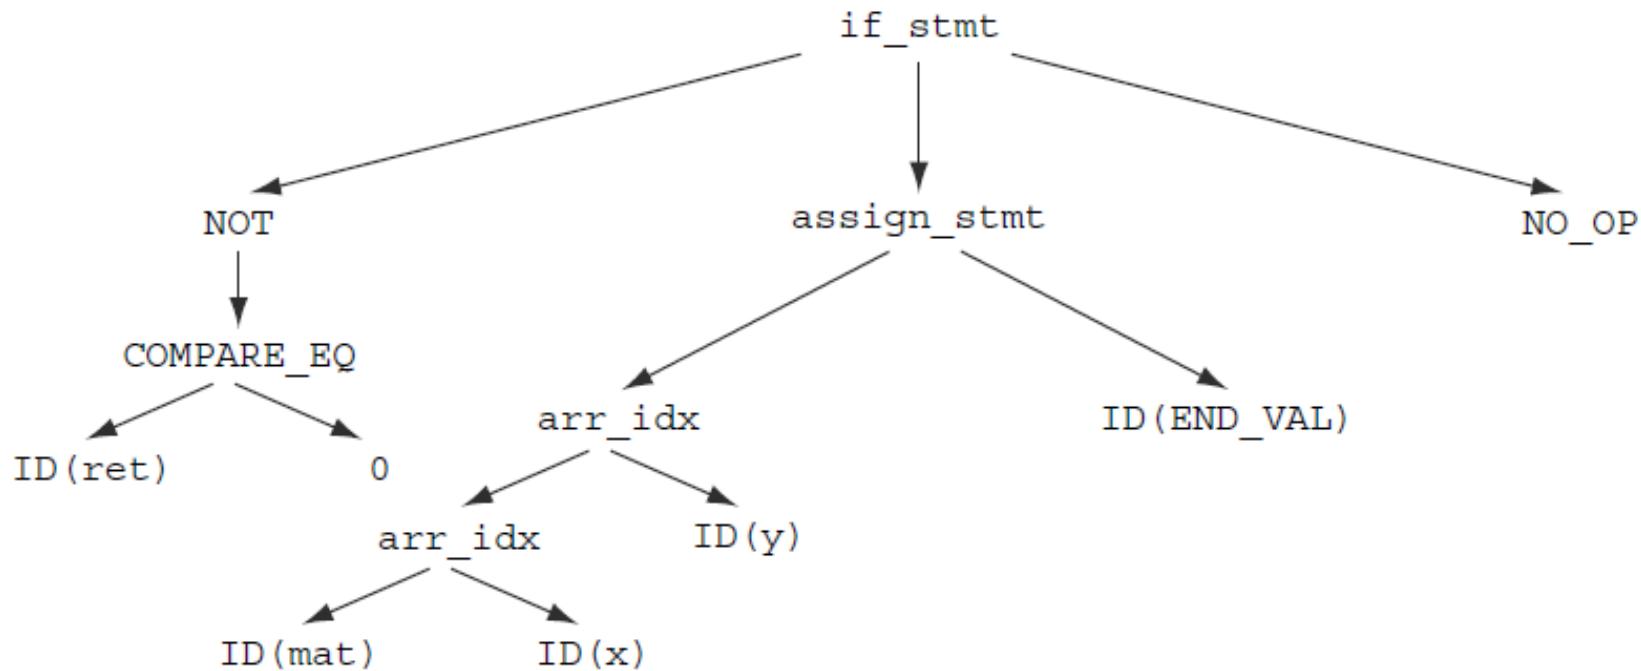

# Mechanisms of static analysis

- Parser, Model Builder, Analysis Engine

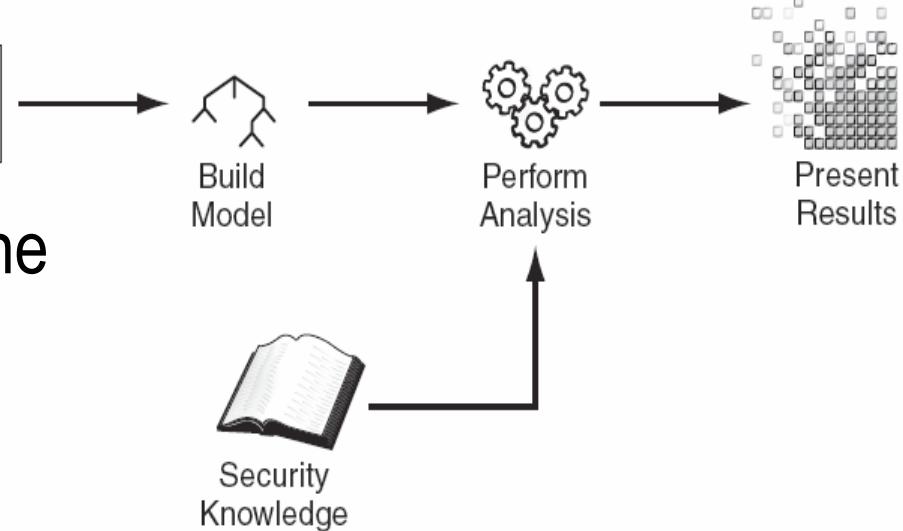

- A parser for every programming language

- generates an Abstract Syntax Tree (AST)

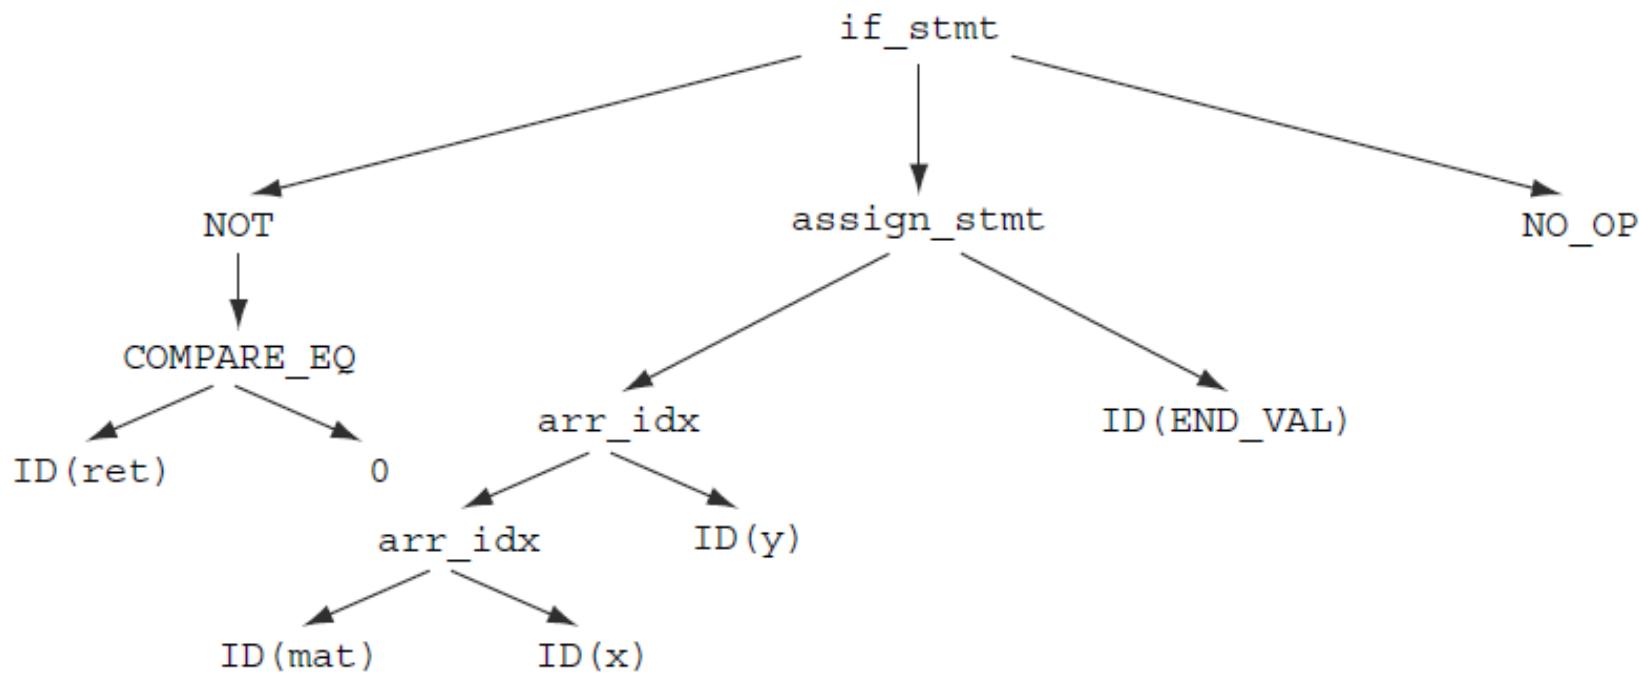

# Mehanizmi statičke analize

```
if (fgets (buf, 100, Source) != buf) {  
    strcpy (buf, "buf");  
    system ( "echo "buf);
```

- ◆ Parser, Model Builder, Analysis Engine
- ◆ Parser za svaki programski jezik
  - generira Abstract Syntax Tree (AST)

### -Lexical analysis and parsing

#### -Example, program section

The corresponding sequence of symbols (tokens)

```
IF LPAREN ID(ret) RPAREN ID(mat) LBRACKET ID(x) RBRACKET LBRACKET  
ID(y) RBRACKET EQUAL ID(END_VAL) SEMI
```

#### -Extracted by syntax rules, parsed according to grammar productions

```
if { return IF; }  
( { return LPAREN; }  
) { return RPAREN; }  
[ { return LBRACKET; }  
] { return RBRACKET; }  
= { return EQUAL; }  
; { return SEMI; }  
/[ \t\n]+/ { /* ignore whitespace */ }  
/\/*.*/ { /* ignore comments */ }  
/[a-zA-Z][a-zA-Z0-9]*"/ { return ID; }
```

```
if (ret) // probably true  
mat[x][y] = END_VAL;
```

```
stmt := if_stmt | assign_stmt  
if_stmt := IF LPAREN expr RPAREN stmt  
expr := lval  
assign_stmt := lval EQUAL expr SEMI  
lval = ID | arr_access  
arr_access := ID arr_index+  
arr_idx := LBRACKET expr RBRACKET
```

# Tehnike analize

## ◆ Leksička analiza (Lexical Analysis) i parsiranje

- Primjer, programski odsječak
- Pripadni slijed simbola (tokena)

```
if (ret) // probably true  
mat[x][y] = END_VAL;
```

```
IF LPAREN ID(ret) RPAREN ID(mat) LBRACKET ID(x) RBRACKET  
LBRACKET ID(y) RBRACKET EQUAL ID(END_VAL) SEMI
```

- Izdvojen sintaksnim pravilima, parsiran prema produkcijama gramatike

```
if { return IF; }  
( { return LPAREN; }  
) { return RPAREN; }  
[ { return LBRACKET; }  
] { return LBRACKET; }  
= { return EQUAL; }  
; { return SEMI; }  
/[ \t\n]+/ { /* ignore whitespace */ }  
//.*/ { /* ignore comments */ }  
/[a-zA-Z][a-zA-Z0-9]*"/ { return ID; }
```

---

```
stmt := if_stmt | assign_stmt  
if_stmt := IF LPAREN expr RPAREN stmt  
expr := lval  
assign_stmt := lval EQUAL expr SEMI  
lval = ID | arr_access  
arr_access := ID arr_index+  
arr_idx := LBRACKET expr RBRACKET
```

---

### -Data Flow Analysis

- Collecting information about the data stream when the program is executed while it is stopped

- Semantic analysis - based on AST and symbol table

- Basic block - a sequence of statements that does not stop or branch except at the end

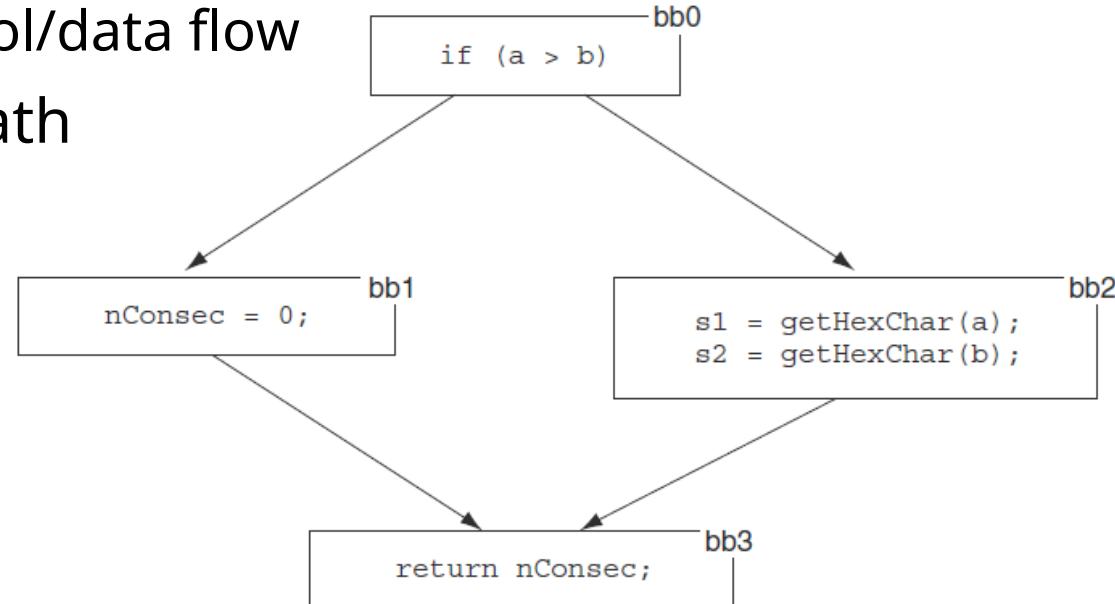

- Control Flow Analysis – control/data flow

- Control Flow Path - data path

### -Flow control chart

- Control Flow Graph (CFG)

- Example: graph with 4 basic blocks

# Tehnike analize (2)

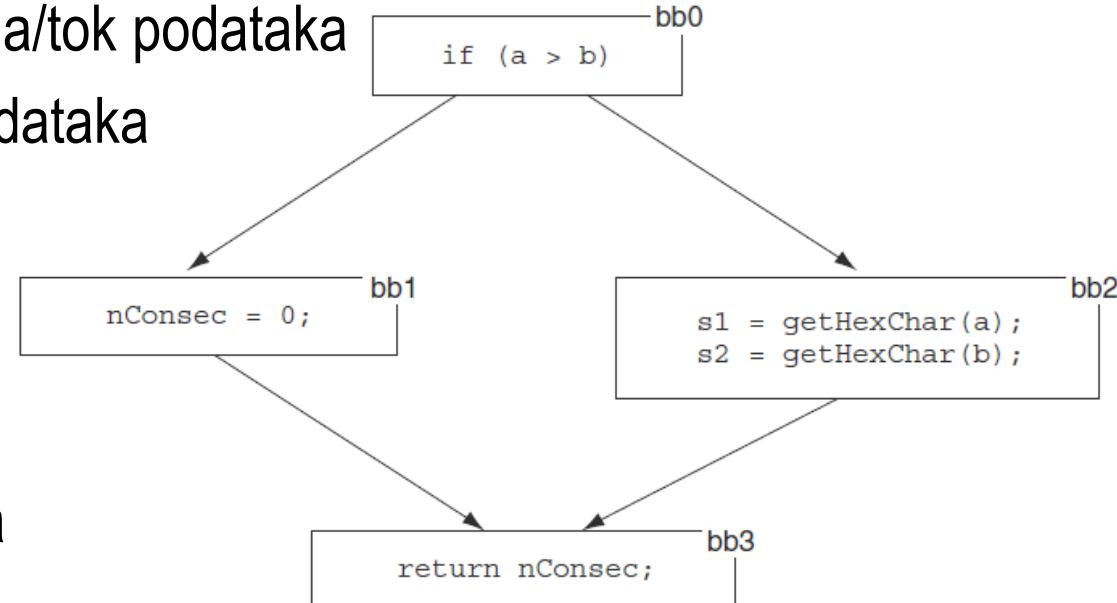

## ◆ Analiza toka podataka (Data Flow Analysis)

- Prikupljanje informacija o kolanju podataka pri izvršenju programa dok je zaustavljen
- Semantička analiza - na temelju AST i tablice simbola

- Osnovni blok - slijed naredbi koji se ne zaustavlja ili grana osim na kraju
- Control Flow Analysis – kontrola/tok podataka
- Control Flow Path - putanja podataka

## ◆ Graf kontrole toka

- Control Flow Graph (CFG)
- Primjer: graf s 4 osnovna bloka

## Analysis techniques (3)

---

### -Taint Analysis

- Identification of variables soiled by user input
- Monitoring their propagation according to possibly vulnerable functions (*sinks*)
- If they are not disinfected before the drain - vulnerability

### -The rules of blob propagation

#### -Source rules - data entry

- Orders *read()*, *getenv()*, *getpass()*, *gets()*.

#### -Sink rules - locations that should not receive dirty data

- Example, Java *Statement.executeQuery()*, C *strcpy()*

#### -Pass-through rules

- If it is *string* soiled and *trim(string)* will be dirty

#### -Cleanse rules - input validation

#### -Entry-point rule - similar to the source, e.g. *main(...)*

---

# Tehnike analize (3)

---

## ◆ Analiza „mrlja” (Taint Analysis)

- Identifikacija varijabli *uprlijanih* korisničkim unosom
- Praćenje njihove propagacije prema moguće ranjivim funkcijama (*sink*)
- Ako nisu dezinficirane prije odvoda - ranjivost

## ◆ Pravila propagacije mrlja

- Pravila izvora (source rules) - unos podataka
  - Naredbe *read()*, *getenv()*, *getpass()*, *gets()*.
- Pravila sливника (sink rules) - lokacije koje ne bi smjele primiti prljave podatke
  - Primjer, Java *Statement.executeQuery()*, C *strcpy()*
- Pravila propuštanja (pass-through)
  - Ako je *string* zaprljan i *trim(string)* će biti zaprljan
- Pravila čišćenja (cleanse rules) - validacija unosa
- Pravila početka (entry-point rule) - slično izvoru, npr. *main(...)*

## Example of static analysis

-AND

```
if ( fgets ( buf , sizeof(buf) , stdin) == buf ) {  
    strcpy ( othr , buf );  
    system ( othr );  
}
```

The diagram illustrates the flow of control and data flow between the lines of code. Line 1 is the if condition. Line 2 is the strcpy call. Line 3 is the system call. Line 4 is the assignment to othr. Line 5 is the buf variable. Arrows show the flow from buf to othr and then to system, and also from the if condition to the strcpy call.

- 1 A source rule for fgets () taints buf othr
- 2 Dataflow analysis connects uses of buf
- 3 A pass-through rule for strcpy taints
- 4 Dataflow analysis connects uses of othr
- 5 Because othr is tainted, a sink rule for system() reports a command injection vulnerability

# Primjer statičke analize

```
if ( fgets ( buf , sizeof(buf) , stdin) == buf ) {  
    strcpy ( othr , buf );  
    system ( othr );  
}
```

The diagram illustrates the data flow analysis. It starts with a call to `fgets` at step 1, which is tainted. This tainted data is then used as the source for a `strcpy` operation at step 3. The `strcpy` operation is a pass-through rule, so it taints the variable `othr` at step 4. Finally, the tainted `othr` variable is passed as an argument to the `system` function at step 5.

- 1 A source rule for `fgets()` taints `buf` other
- 2 Dataflow analysis connects uses of `buf`
- 3 A pass-through rule for `strcpy` taints
- 4 Dataflow analysis connects uses of `othr`
- 5 Because `othr` is tainted, a sink rule for `system()` reports a command injection vulnerability

## Advantages and disadvantages of static analysis

---

### -Advantages

- Full code coverage (code coverage) - in theory
- The potential to confirm the absence of entire classes of bugs
- It catches *bugs* different compared to dynamic analysis

### -Weaknesses

- High false detection rate
- Difficult test shaping
- Complexity of construction (tool) - "parser for every language"
  - not enough when using additional frameworks or libraries
- Not having the entire source code in practice (OS, shared libraries, DLLs, ...)

# Prednosti i nedostaci statičke analize

---

## ◆ Prednosti

- Potpuna pokrivenost koda (code coverage) - u teoriji
- Potencijal potvrde izostanka čitavih klasa bugova
- Hvata bugove različite u odnosu na dinamičku analizu

## ◆ Slabosti

- Visok postotak pogrešnog otkrivanja
- Teško oblikovanje testa
- Složenost izgradnje (alata) - „parser za svaki jezik“
  - nedovoljno kada se koriste dodatni okviri ili biblioteke
- Neimanje cjelokupnog izvornog koda u praksi (OS, shared libraries, DLLs, ...)

# Tools for static analysis

---

- [https://www.owasp.org/index.php/Source\\_Code\\_Analysis\\_Tools](https://www.owasp.org/index.php/Source_Code_Analysis_Tools)
  
- StyleCop <https://github.com/StyleCop/StyleCop> - C#
- CodeSmart <http://www.axtools.com/> - C#, C++, VB.NET
- NDepend <http://www.ndepend.com/> - C#, jDepend for Java
  
- VS Code Analysis (FxCop, Roslyn analyzers) - C#, C/C++, ...
- PMD - Java, C, C++, C#, Groovy, PHP, Ruby, Fortran, JavaScript, PLSQL, ...
- Fortify Source Code Analyzer - 25 languages
- Checkstyle - Java
- Klocwork K7 Suite - Java
- FindBugs, Find Security Bugs - Java
- Coverity Prevent - C#, clang, gcc

# Alati za statičku analizu

---

- [https://www.owasp.org/index.php/Source\\_Code\\_Analysis\\_Tools](https://www.owasp.org/index.php/Source_Code_Analysis_Tools)
  
- StyleCop <https://github.com/StyleCop/StyleCop> - C#
- CodeSmart <http://www.axtools.com/> - C#, C++, VB.NET

- Fortify Source Code Analyzer - 25 jezika
- Checkstyle - Java
- Klocwork K7 Suite - Java
- FindBugs, Find Security Bugs - Java
- Coverity Prevent - C#, clang, gcc

# Example: StyleCop

The screenshot shows the Visual Studio IDE interface. On the left, the code editor displays `UserModel.cs` with C# code for a `UserModel` class. The code includes properties for `ID`, `CinemaID`, `Username`, `Password`, `Name`, `Surname`, and `Role`, along with their corresponding getters and setters. Below the code editor is the Error List window, which shows 55 warnings related to spacing rules.

On the right, a `StyleCop 5.0 (5.0.6419.0) Project Settings` dialog box is open. The `Rules` tab is selected. Under `Enabled rules`, the `C#` category is expanded, showing sub-categories like `Documentation Rules`, `Layout Rules`, etc., with several specific rules checked under `Spacing Rules`. In the `Detailed settings` section, the `Analyze designer files` checkbox is checked. At the bottom of the dialog, a note states: `Indicates whether to include designer files (*.Designer.cs).` The dialog has `OK`, `Cancel`, and `Apply` buttons at the bottom right.

# Primjer: StyleCop

The screenshot shows a Visual Studio interface with the following components:

- Code Editor (UserModel.cs):** Displays C# code for a `UserModel` class.
- Toolbox:** Standard Visual Studio toolbox items.
- Server Explorer, Toolbox, SQL Server Object Explorer:** Standard Visual Studio toolbars.
- StyleCop 5.0 Project Settings Dialog:** Opened over the code editor.
  - Rules Tab:** Shows the configuration for running StyleCop rules on the project.
  - Enabled rules section:** Lists categories like C#, Documentation Rules, Layout Rules, etc., with specific rules like SA1000, SA1001, etc., checked.
  - Detailed settings section:** Contains checkboxes for "Analyze designer files" (checked) and "Analyze generated files".
  - Note:** A note at the bottom indicates whether to include designer files (\*.Designer.cs).
  - Buttons:** OK, Cancel, Apply.
- Error List:** Shows 55 warnings related to invalid spacing in the code.

# Example: IBM Rational AppScan Source Edition for Security

The screenshot shows the IBM Rational AppScan Source Edition for Security interface. The main window displays a trace analysis for a JSP file named `feedbacksuccess.jsp`. The trace shows a flow from a user input source (e.g., `getAttribute()`) through Java objects (`java.lang.StringBuilder`) to a sink (e.g., `JspWriter.print()`). The interface includes a left sidebar for findings, a bottom code editor showing Java code, and right-hand panels for finding details and remediation assistance.

**Trace Details:**

- Source: `javax.servlet.jsp.JspWriter.print`
- Sink: `javax.servlet.jsp.JspWriter.print(ja...)`
- Java Objects:
  - `java.lang.StringBuilder.append`
  - `java.lang.StringBuilder.toString`

**Code Editor (feedbacksuccess.jsp.java):**

```
49 out.print( (request.getAttribute("message_feedback")!=null)? ", "+request.getAttribute("message_fe...
50 out.write( ". They will be reviewed by our Customer Service staff and given the full attention tha...
51 String email = (String) request.getParameter("email_addr");
52     boolean regExMatch = email!=null && email.matches(ServletUtil.EMAIL_REGEX);
53     if (email != null && email.trim().length() != 0 && regExMatch) {
54     out.write("\r\n\t\tOur reply will be sent to your email: ");
55     out.print( ServletUtil.sanitizeBasic(email.toLowerCase()) /*email.toLowerCase() */ );
56     out.write("\r\n\t\t");
57 } else {
58     out.write("\r\n\t\tHowever, the email you gave is incorrect ());
59 out.print(email.toLowerCase()); /&ServletUtil.sanitizeWebEmail.toLowerCase(); /);
```

**Finding Detail:**

- Context:
- Classification:
- Vulnerability Type:
- Severity:
- Bundle:

**Mitigation:**

To defend against these problems, the application should apply appropriate validation and encoding on the string. The validation mechanism should ensure that the string does not contain malicious data and code. HTML entity encoding should be applied to data that is not intended to be interpreted as scripts. For more details on validation and encoding, please refer to [Validation\\_Required](#) and [Validation\\_EncodingRequired](#).

**Example:**

The following JSP page prints the user provided name in the resulting welcome page.

```
welcome.jsp
<html> Welcome
<% request.getParameter("name")%>
</html>
```

# Primjer: IBM Rational AppScan Source Edition for Security

The screenshot shows the IBM Rational AppScan Source Edition for Security interface. The main window displays a trace analysis for a JSP page named `feedbacksuccess.jsp`. The trace shows a flow from a user input source (`java.servlet.ServletRequest.getAttribute`) through several Java objects (`java.lang.StringBuilder.append`, `java.lang.StringBuilder.toString`) to a sink (`java.servlet.JspWriter.print`). The `Trace` pane also shows the corresponding Java code in `feedbacksuccess.jsp.java`.

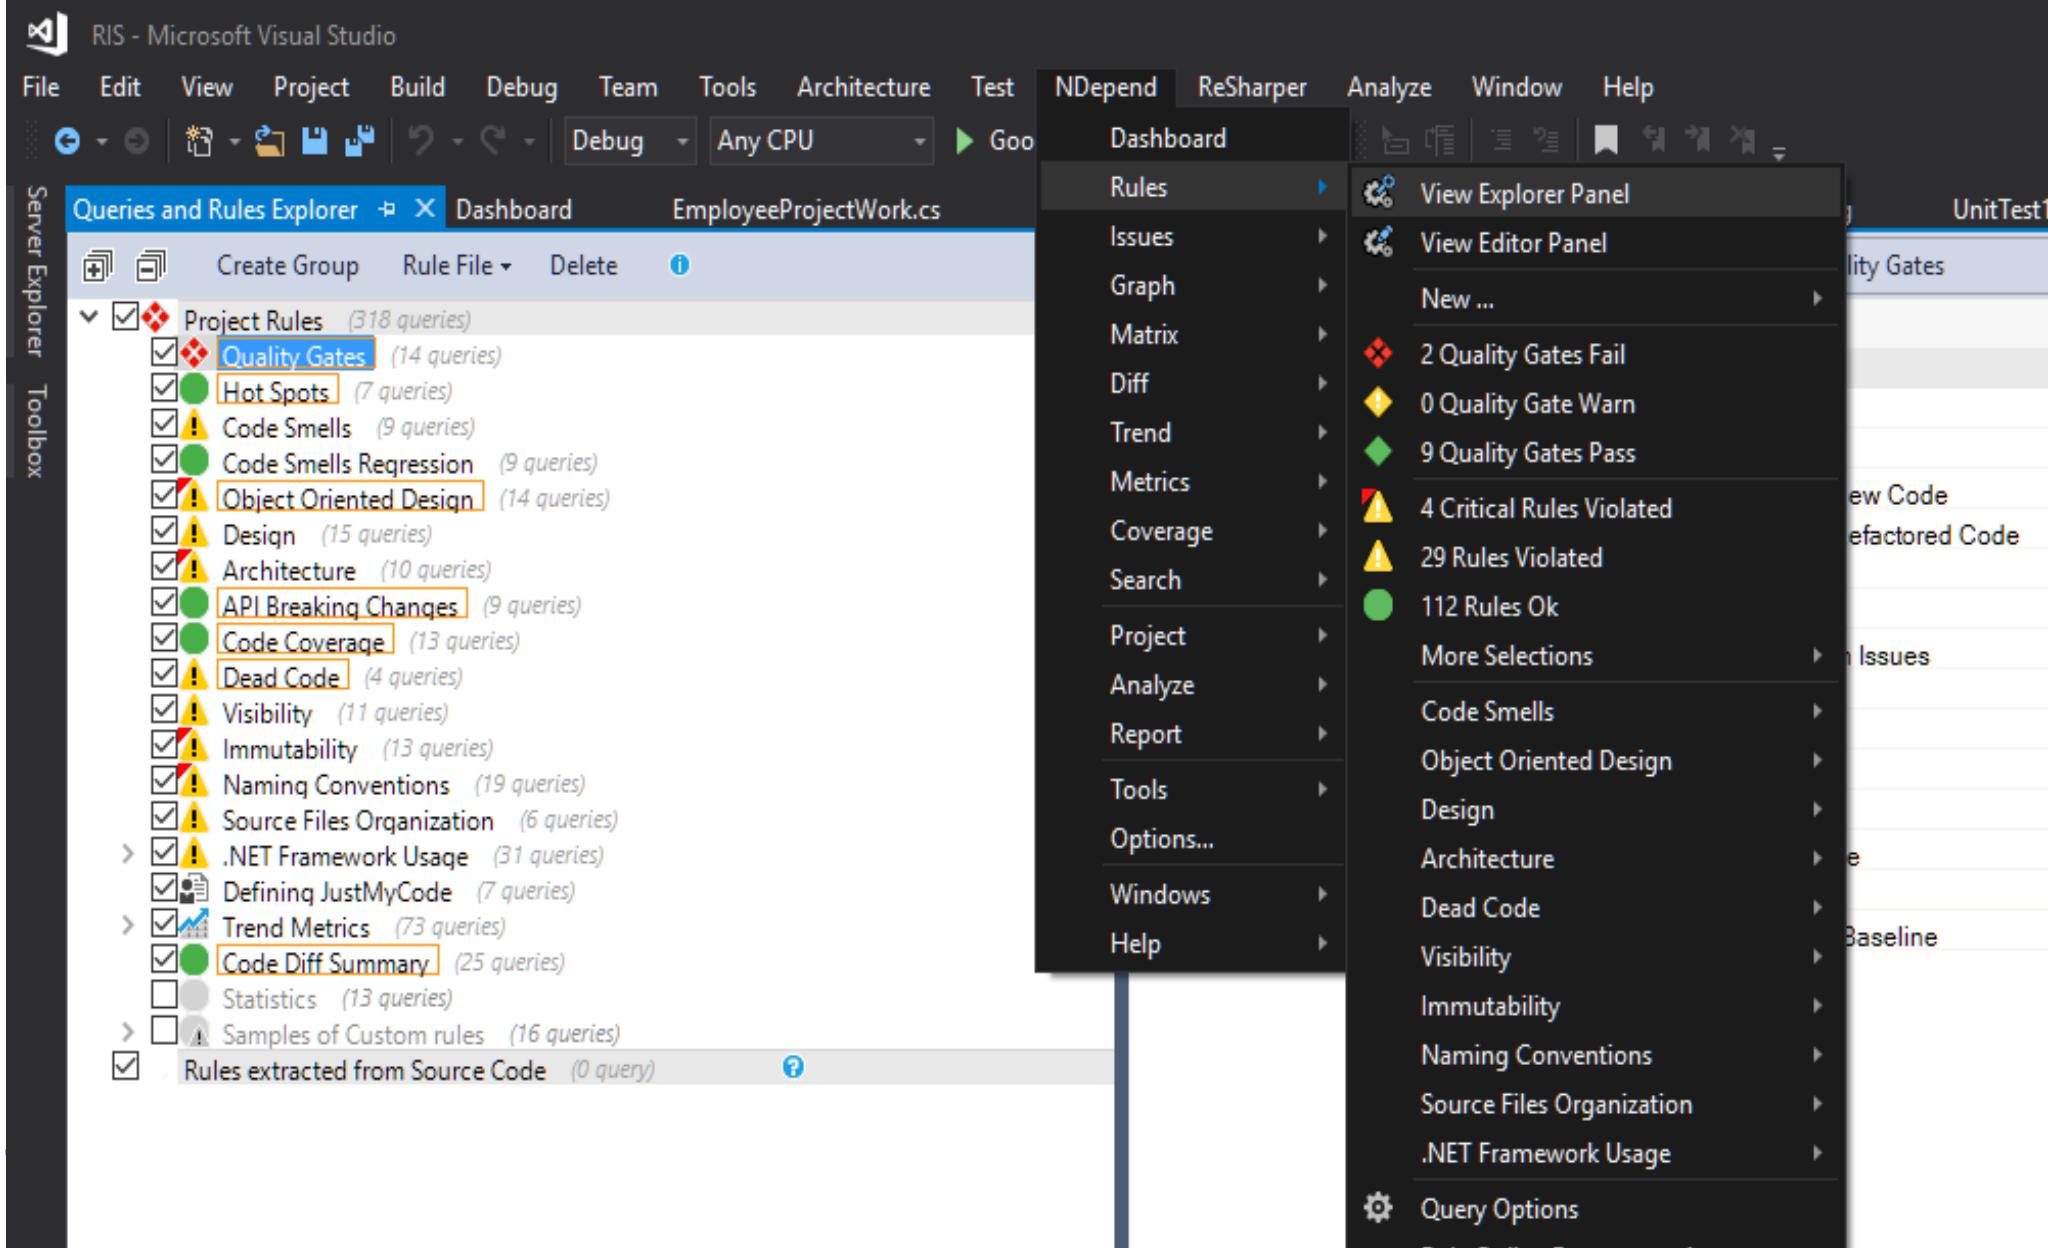

The `Findings` pane on the left lists various vulnerabilities found in the application, including `Authentication.Entity`, `CrossSiteScripting`, `Vulnerability`, `ErrorHandling.RevealDetail`, and `Injection`. The `Finding Detail` pane provides detailed information about a selected finding, including context, classification, severity, and mitigation advice. The `Remediation Assistance` pane offers suggestions for fixing the identified issue.

**Mitigation:**  
To defend against these problems, the application should apply appropriate validation and encoding on the string. The validation mechanism should ensure that the string does not contain malicious data and code. HTML entity encoding should be applied to data that is not intended to be interpreted as scripts. For more details on validation and encoding, please refer to [Validation\\_Required](#) and [Validation\\_EncodingRequired](#).

**Example:**  
The following JSP page prints the user provided name in the resulting welcome page.

```
welcome.jsp
<html>
    <body>
        <%= request.getParameter("name")%>
    </body>
</html>
```

# Example: NDepend

# Primjer: NDepend

The screenshot shows the Microsoft Visual Studio interface with the NDepend extension installed. The NDepend menu is open, displaying various analysis options and status information. The status bar at the bottom right indicates 'UnitTests' and 'Baseline'.

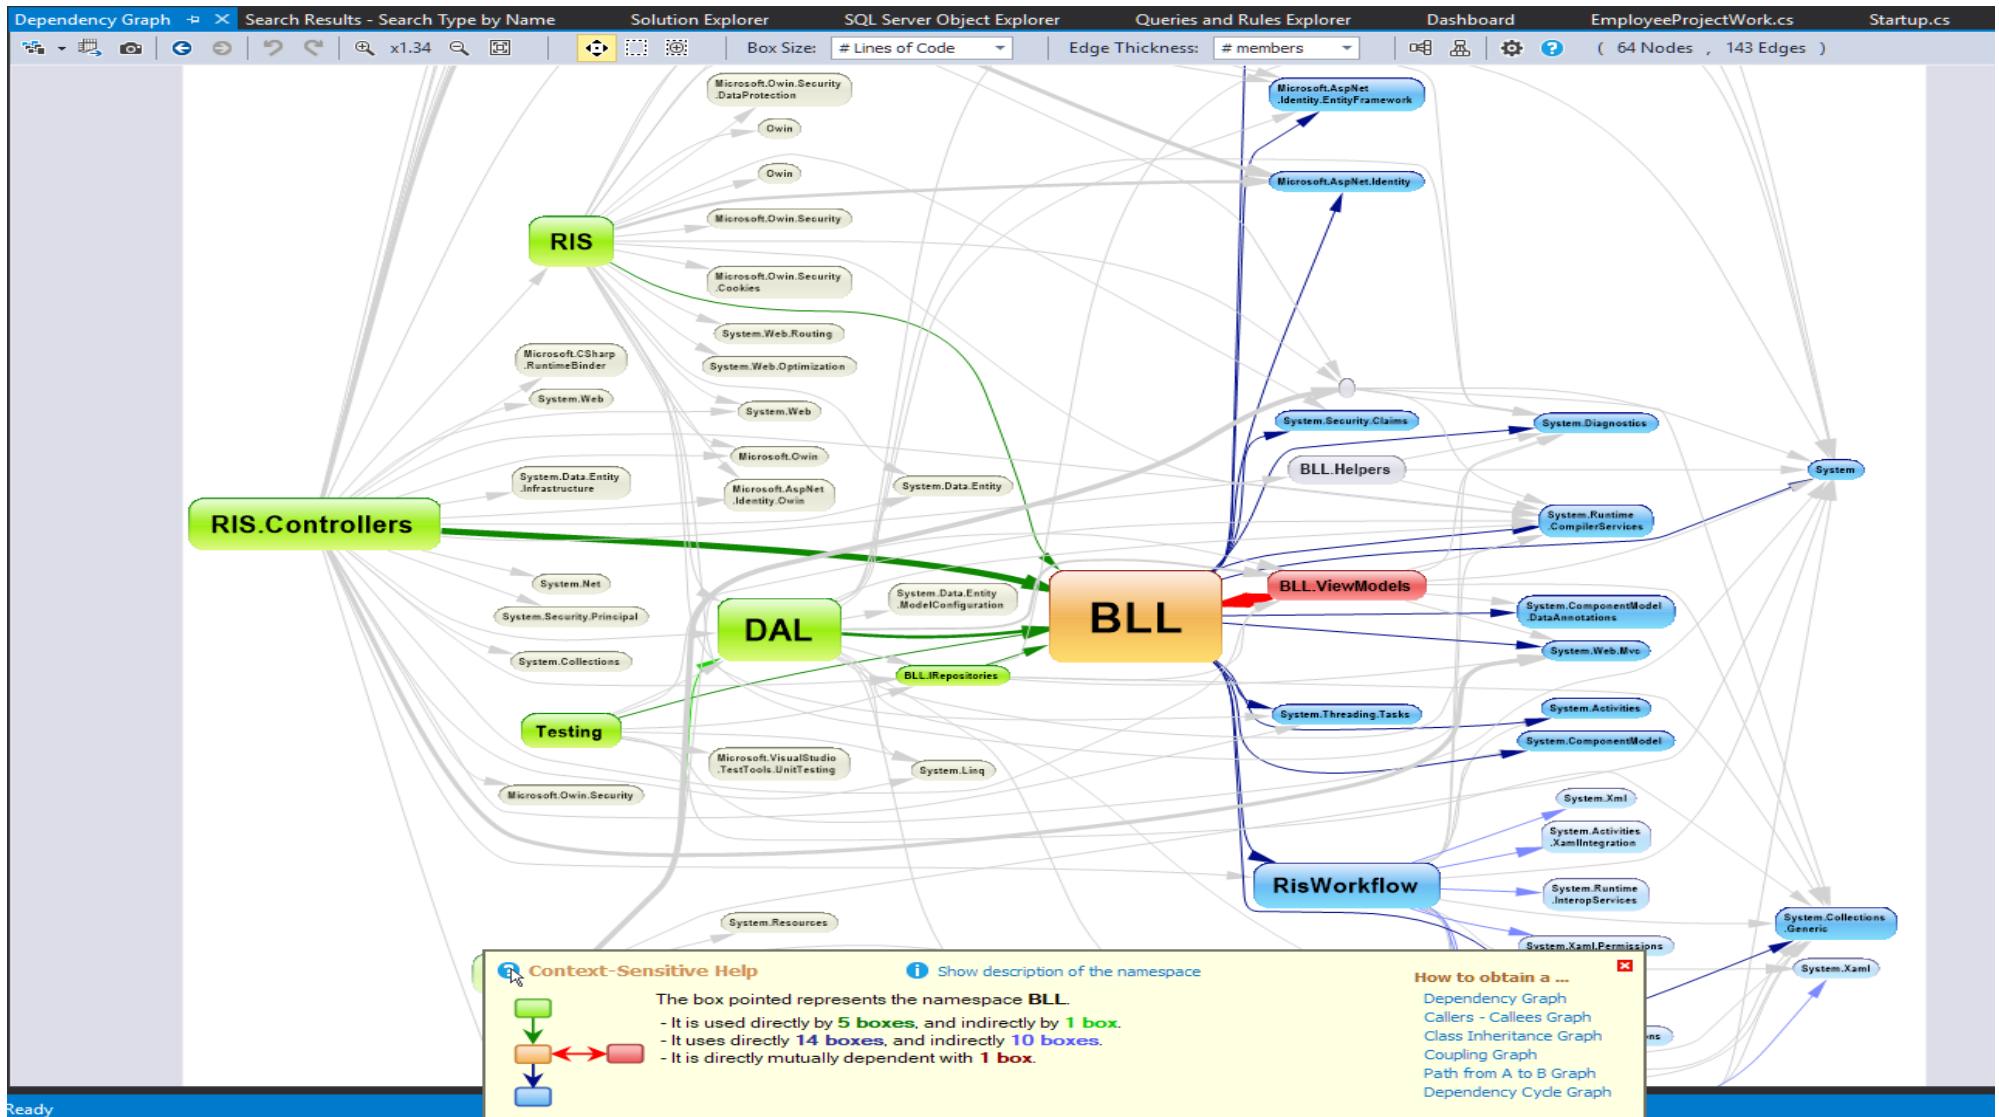

**NDepend Menu Options:**

- Dashboard
- Rules
- Issues
- Graph
- Matrix
- Diff
- Trend
- Metrics
- Coverage
- Search
- Project
- Analyze
- Report
- Tools
- Options...
- Windows
- Help

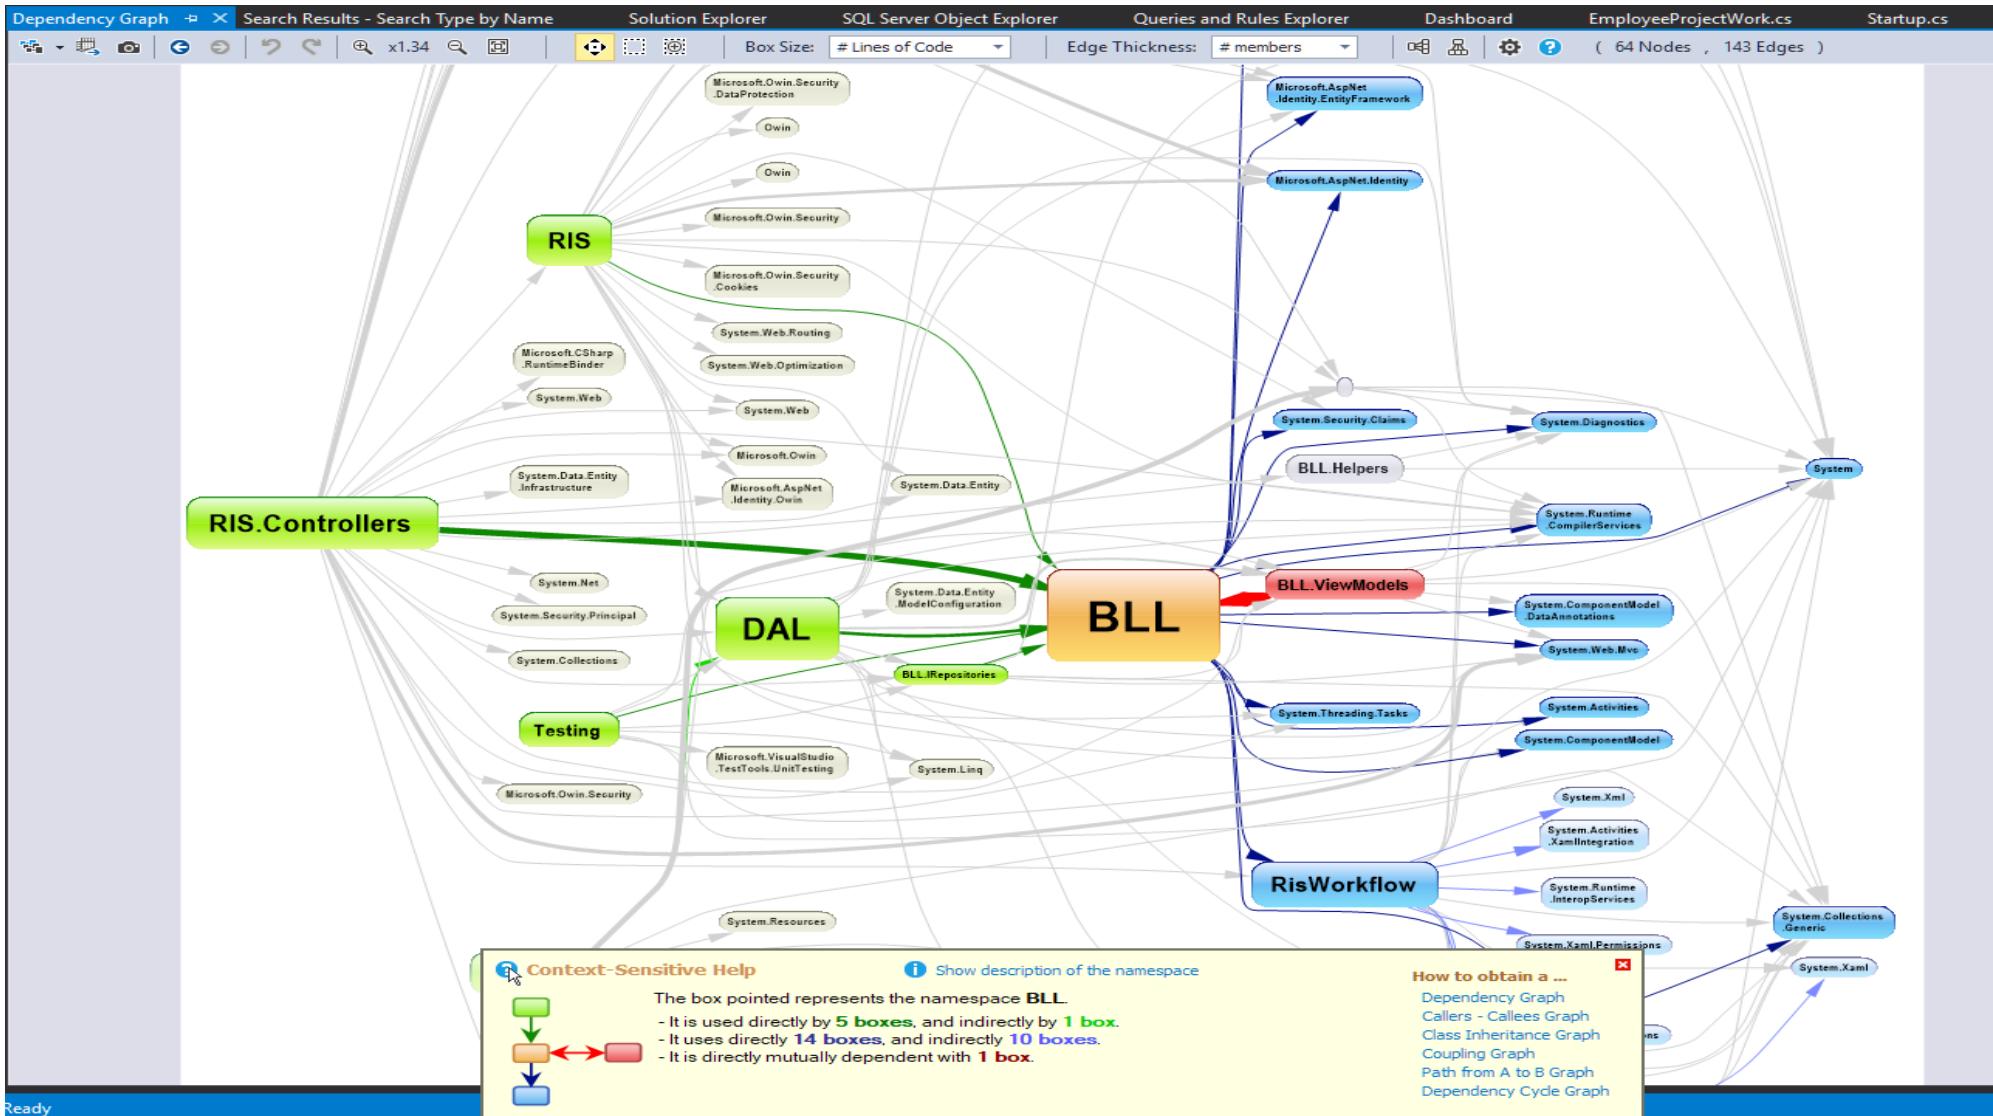

**Status Bar:**

- UnitTests
- Baseline

# Example: application component dependency

# Primjer: zavisnost komponenti aplikacije

---

# **Dynamic check**

Dynamic Analysis

Fuzzing

Penetration Testing

---

---

# Dinamička provjera

Dynamic Analysis  
Fuzzing  
Penetration Testing

---

# Fuzzing - "combing" (eng. fuzz = hair)

---

- DAST (The Good, the Bad and the Ugly)
  - fault injection into the application (fuzzing, fuzz testing)
  - sending incorrect, unexpected or random data to the program input
  - similar to regression, only with bad data
  - "combing" applications, protocols, files
- Advantages:
  - simplicity, platform, language independence
- Disadvantages:
  - application to a narrow set of vulnerabilities, eg. *Buffer overflows, Integer overflows,...*
  - complex application to technologies (Web 2.0, JSON, Flash, HTML 5.0, Jscript)
  - relatively long duration (permutations of incorrect data samples)

# Fuzzing - "pročešljavanje" (eng. fuzz = dlačica)

---

- ◆ DAST (The Good, the Bad and the Ugly)
  - ubrizgavanje kvara u aplikaciju (fuzzing, fuzz testing)
  - slanje neispravnih, neočekivanih ili nasumičnih podataka ulazu programa
  - slično regresiji, samo s lošim podacima
  - „češljanje” aplikacija, protokola, datoteka
- ◆ Prednosti:
  - jednostavnost, nezavisnost o platformi, jeziku
- ◆ Nedostaci:
  - primjena na uzak skup povredivosti, pr. *Buffer overflows*, *Integer overflows*, ...
  - složena primjena na tehnologije (Web 2.0, JSON, Flash, HTML 5.0, Jscript)
  - relativno dugo trajanje (permutiranja uzorka neispravnih podataka)

## Procedures

### -Glupo = Dumb (mutational) fuzzing

- enough less knowledge about the goal and the tools
- pseudorandom anomalies of correct data
- repercussions
  - more analysis needed
  - redundancy of findings

### -Smart (generational) fuzzing

- data generated based on the model
- requires in-depth knowledge of the target and specialized tools
- purposeful anomalies by knowledge of formats, standards, ... (PDF, RFC)
- repercussions
  - less need for analysis
  - less duplication of findings

#### **Standard HTTP GET request**

GET /index.html HTTP/1.1

#### **Anomalous requests**

AAAAAA...AAAA /index.html  
HTTP/1.1

GET /////index.html HTTP/1.1

GET /AAAAAAAAAAAAA.html HTTP/1.1

GET /index.html  
HTTTTTTTTTTP/1.1

GET /index.html  
HTTP/1.1.1.1.1.1.1.1

# Postupci

- ◆ Glupo = Dumb (mutational) fuzzing
    - dovoljno manje znanja o cilju i alatima
    - pseudoslučajne anomalije ispravnih podataka
    - posljedica
      - potrebno više analize
      - redundancija nalaza
  - ◆ Pametno = Smart (generational) fuzzing
    - podaci generirani na temelju modela
    - zahtijeva dubinsko poznavanje cilja i specijalizaciju
    - smišljene anomalije poznavanjem formata, standarda
    - posljedica
      - manja potreba za analizom
      - manje dupliciranje nalaza

## Standard HTTP GET request

GET /index.html HTTP/1.1

## Anomalous requests

# **Penetration testing (Pen Test), ethical hacking**

---

- assessment of system or network security by simulating a malicious attack
- person, team, preferably external consultants
- written permission of the owner (implementation of illegal activities)

## **-Purpose**

- Confirmation of the functionality of security controls
- Timely detection of security flaws
- Prevention of security incidents
- Investment justification
- Compliance with regulatory requirements

# Penetracijsko testiranje (Pen Test), etičko hakiranje

---

- procjena sigurnosti sustava ili mreže simuliranjem zlonamjernog napada
  - osoba, ekipa, poželjno vanjski konzultanti
  - pismena dozvola vlasnika (provedbe nezakonitih aktivnosti)
- 
- ◆ Svrha
    - Potvrda funkcionalnosti sigurnosnih kontrola
    - Pravovremeno uočavanje sigurnosnih propusta
    - Prevencija sigurnosnih incidenata
    - Opravdavanje investicije
    - Ispunjavanje regulatornih zahtjeva

# Approach to penetration testing

---

- Types of verification according to the availability of information
  - without available information (eng.*black-box test*) - as a real attack
  - with all information (eng.*white-box test*) - the worst case, when the attacker knows everything, or the simulation of an attack by an internal attacker
  - with partially available information (eng.*gray-box test*) - hybrid
- Test starting point criterion
  - External - from a remote location (Internet) to publicly available systems
  - Internal - from the intranet, simulation of an incident of unauthorized access to the internal network infrastructure
- Other criteria
  - Range, stealth, techniques, aggressiveness

# Pristup penetracijskom testiranju

---

- ◆ Vrste provjere prema raspoloživosti informacija
  - bez dostupnih informacija (eng. *black-box test*) - kao pravi napad
  - sa svim informacijama (eng. *white-box test*) - najgori slučaj, kad napadač sve zna, ili simulacija napada od strane unutrašnjeg napadača
  - s djelomično dostupnim informacijama (eng. *gray-box test*) - hibrid
- ◆ Kriterij početne točke testa
  - Vanjski - s udaljene lokacije (Interneta) prema javno dostupnim sustavima
  - Unutrašnji - s intraneta, simulacija incidenta neovlaštenog pristupa unutrašnjoj mrežnoj infrastrukturi
- ◆ Ostali kriteriji
  - Opseg, prikrivenost, tehnike, agresivnost

# Performing a penetration test

---

## - **Research**(Eng.*reconnaissance*), scouting

- the examiner tries to collect as much information as possible.
- passive - publicly available information (eg data from social networks, Google)
- active - research tools (e.g. *nslookup*), to determine certain parameters

## - **Scanning**(Eng.*scanning*)

- the tester scans open ports (*port scanning*) using tools (e.g. Nmap)
- goal - enumeration of services, versions of enumerated services and OS (*OS and service fingerprinting*).
- vulnerability scan (*vulnerability scanning*), automated tools (e.g. OpenVAS)

## - **Gaining access**(Eng.*obtaining access*)

- exploitation of vulnerabilities, either manually or with a tool (e.g. Metasploit),
- depending on the agreement with the owner, some vulnerabilities will not be exploited (eg server crash)

## - **Access retention**(Eng.*maintaining access*)

- examiner installs malicious *backdoor* and *rootkit* programs for further access to the system
- this and the next phase are not usually carried out in practice, but represent a scenario of a real attack

## - **Erasing traces**(Eng.*erasing records*)

- the examiner attempts to delete log entries that would indicate their unauthorized access

# Izvođenje penetracijskog testa

---

- ◆ **Istraživanje** (eng. *reconnaissance*), izviđanje
  - ispitivač pokušava prikupiti što više informacija.
  - pasivno - javno dostupne informacije (npr. podaci s društvenih mreža, Google)
  - aktivno - istraživački alati (npr. *nslookup*), da bi se odredili određeni parametri
- ◆ **Skeniranje** (eng. *scanning*)
  - ispitivač skenira otvorene portove (*port scanning*) korištenjem alata (npr. Nmap)
  - cilj - enumeracija servisa, verzije enumeriranih servisa i OS (*OS and service fingerprinting*).
  - skeniranje ranjivosti (*vulnerability scanning*), automatiziranim alatima (npr. OpenVAS)
- ◆ **Dobivanje pristupa** (eng. *obtaining access*)
  - iskorištavanje ranjivosti, ručno ili alatom (npr. Metasploit),
  - ovisno o dogovoru s vlasnikom, neke ranjivosti se neće iskorištavati (npr. rušenje poslužitelja)
- ◆ **Zadržavanje pristupa** (eng. *maintaining access*)
  - ispitivač instalira zločudne *backdoor* i *rootkit* programe za daljnji pristup sustavu
  - ova i naredna faza se u praksi najčešće ne provode ali predstavljaju scenarij realnog napada
- ◆ **Brisanje tragova** (eng. *erasing evidence*)
  - ispitivač pokušava izbrisati dnevničke zapise koji bi ukazivali na njihov neovlašteni pristup

<b>Harvester</b>	Researching publicly available information using search engines, social networks, etc.	Research
<b>Nmap</b>	Network research and port scanning.	Scanning
<b>QualysGuard (Network)</b>	Network scan for known vulnerabilities.	Scanning
<b>QualysGuard (WAS)</b>	Vulnerability scanning of web applications.	Scanning
<b>ASPauditor</b>	Identification of vulnerable and poorly configured ASP.NET servers.	Scanning
<b>Nobody</b>	Scanning web servers for various vulnerabilities, such as dangerous ones files etc.	Scanning
<b>REC</b>	A multifunctional tool for penetration testing of web applications.	Scanning
<b>Sqlmap</b>	SQL injection vulnerability detection and exploitation.	Conducting an attack
<b>Metasploit</b>	A multifunctional platform for exploiting vulnerabilities.	Conducting an attack
<b>HTTP DoS</b>	Denial of service at the application layer.	Conducting an attack
<b>Hydra</b>	Remote password cracking.	Conducting an attack
<b>Wireshark</b>	Recording and analysis of network traffic.	Conducting an attack

Alat	Osnovna funkcionalnost	Faza
Harvester	Istraživanje javno dostupnih informacija korištenjem tražilica, društvenih mreža itd.	Istraživanje
Nmap	Istraživanje mreže i skeniranje portova.	Skeniranje
QualysGuard (Network)	Mrežno skeniranje poznatih ranjivosti.	Skeniranje
QualysGuard (WAS)	Skeniranje ranjivosti web aplikacija.	Skeniranje
ASPAuditor	Identifikacija ranjivih i loše konfiguiranih ASP.NET poslužitelja.	Skeniranje
Nikto	Skeniranje web poslužitelja na razne propuste, kao što opasne datoteke itd.	Skeniranje
ZAP	Multifunkcionalni alat za penetracijsko testiranje web aplikacija.	Skeniranje
Sqlmap	Otkrivanje i iskorištavanje ranjivosti SQL umetanja.	Provodenje napada
Metasploit	Multifunkcionalna platforma za iskorištavanje ranjivosti.	Provodenje napada
HTTP DoS	Uskraćivanje usluge na aplikacijskom sloju.	Provodenje napada
Hydra	Udaljeno probijanje lozinki.	Provodenje napada
Wireshark	Snimanje i analiza mrežnog prometa.	Provodenje napada

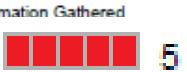

## Example: Nmap and QualysGuard

```
root@bt :~# nmap -sS -sV 22.22.22.22 Host is up  
(0.0027s latency).
```

A problem has been detected and Windows has been shut down to prevent damage to your computer.

If this is the first time you've seen this Stop error screen, restart your computer. If this screen appears again, follow these steps:

Check to be sure you have adequate disk space. If a driver is identified in the Stop message, disable the driver or check with the manufacturer for driver updates. Try changing video adapters.

Check with your hardware vendor for any BIOS updates. Disable BIOS memory options such as caching or shadowing. If you need to use Safe Mode to remove or disable components, restart your computer, press F8 to select Advanced Startup options, and then select Safe Mode.
